

LOCALIZATION LAMP

For identifying control pushbuttons in the dark.

This diagram may be useful in case of controls acting on relays, electronic devices or energy saving lamps (for example, compact fluorescent lamps).

1 Before inserting the LED, detach the plastic tab and install the device on the support

2 Insert LED

Note: In the case where the switch is connected to energy saving lamps (e.g. compact fluorescent lamps or LEDs), the neutral wire must be brought down to the switch and connected to the localisation lamp. If this is not done, it might result that the energy saving lamps remain dimmed or flicker when the lights are switched off.
